AWS CloudWatch

CloudWatch Metrics

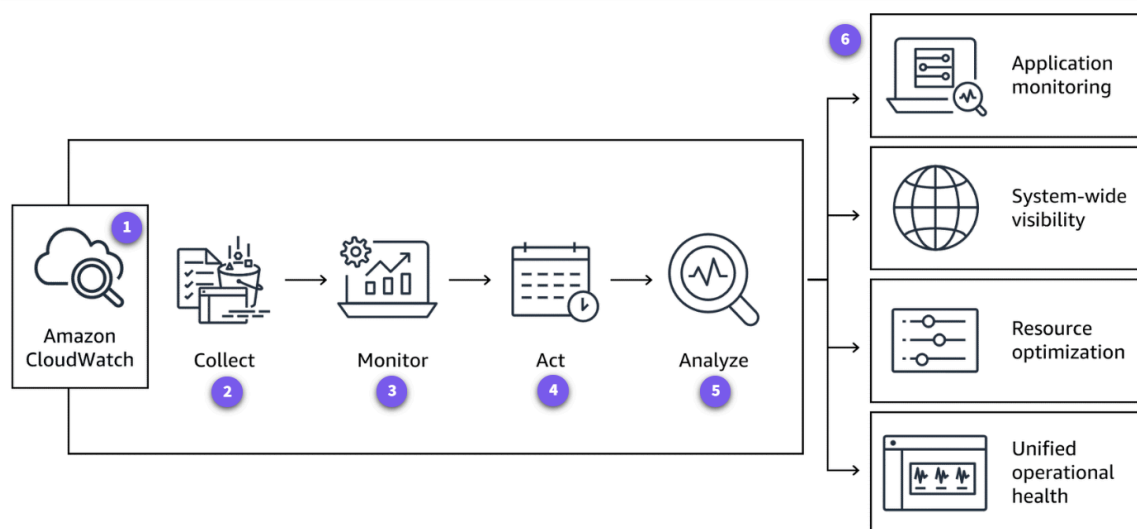

cloud watch is basically a metrics repository

Metrics uniquely defined by a namespace, metric name and

It has Function responds to

- performance change
- optimize resource use

and provides operational health

it shows resource information According to namespace, dimension, metric and statistics

for example)

if you set command, “I want to see CPU occupancy of EC2 instance”,

namespace	EC2	dimension	each instance
metric	CPU occupancy	statistics	mean of CPU occupancy

- **AWS cloudwatch gives UI interaction to use function like that command**

Apply our project

- **create dash board lambda usage**

User Guide

- Identify success criteria
- Ingesting Data
- Agent deployment
- Avoid alarm fatigue
- Create context-rich dashboard
- Personally Identifiable Information

HOW?

we choose two items in CloudWatch

- 1. Synthetics**
- 2. RUM**

Synthetics use for user experience
